

WRITING ON CIRCLES AND CURVES  
WITH DEBBY REELITZ

LETTERINGDESIGN.COM

## THE EXPLANATION

Equation to determine the circumference of a circle  $C = 2\pi r$

Circumference =  $(2)(3.14)$  Radius  
 $C = \text{distance around edge of the circle} = (6.28) \text{ Radius}^*$

$C = \text{baseline}$

$C = \text{length of text you want on your circle}$

distance between the compass points  
 \* this is what we want to calculate

The Algebra!!

$$C = (6.28) R$$

$$\left(\frac{1}{6.28}\right) C = (6.28) R \left(\frac{1}{6.28}\right)$$

$$\frac{C}{6.28} = R$$

### To Letter in a Circle

- 1) Write text on a straight line. Since consistency is extremely important, I highly recommend using a baseline and waistline and writing it 2-3 times. Make notes about x-height, nib size and brand, paper.
- 2) Measure the length of your text.
- 3) Divide the text into four equal parts, marking each section.

- 4) Use the formula:

$$\frac{\text{Circumference (a.k.a. length of text)}}{6.28} = R \text{ (a.k.a. distance between compass points)}$$

- 5) Set compass to radius length
- 6) Draw circle, this is your baseline
- 7) With a ruler, mark your waistline. Be as precise as possible. This second larger circle is the waistline.
- 8) Divide the circle into 4 equal sections.
- 9) Letter your text. Be patient. Don't try to finish lettering the circle at one time. I am extremely likely to smudge if I try going much more than half way around at one time.

**When the circle has to be a set size:**

- 1. Measure the radius (R) of the circle
- 2. Multiply R times 6.28 = the distance your text needs to be

3. Modify the lettering as needed to create that specific length. Variations can include:

- \*nib size
- \*x-height
- \*kerning (spacing between characters)
- \*decorative elements in the circle
- \*thickness of the letters
- \*density of the letters

4. Be sure to take notes of all your variations, what nib, brand, size, paper, x-height, etc. When you find a combination that works, you want to know how you created it!

5. To improve accuracy of the lettering, divide circle and text into segments, quarters or even eighths
